

Registration Ref.	#132 (11/09/2008)
Cultivar Name	<i>P. caerulea</i> 'Alisus Betica'
Originator	Pepa Fernández (Spain)
Parentage	(Selection of species)
Description	A branch sport of <i>P. caerulea</i> co-existing with a more common all-white sport. It has some resemblance to <i>P. caerulea</i> 'Pierre Pomie'. Stems more reddish than on original plant; flowers 10cm in diameter; petals and sepals white; corona filaments red/purple at base, white to apex. Does not form fruits as readily as the 'normal' flowers. Foliage and flowering period otherwise typical of the species. The name is an acronym of the names of the breeder's children and the Roman region of Spain (Hispania Baetica).
